

I think it is important to separate the narrow band modes from wide band modes on 160 meters. Voluntary compliance is a nice concept but does not receive universal acceptance. By codifying band segments as is done on the other amateur radio bands, the narrow band modes will be protected. Clearly, 40 Khz for narrow modes and 160 Khz for wide modes of operation should be sufficient for all users. I support the adoption of RM-10352. Kurt Pauer W6PH.
